Additional Comments	25

Welcome to the Freeway Management Survey!

Before you get started, please review the following definitions:

Intelligent Transportation Systems (ITS) encompass the electronic, communication, and information processing technologies that enable transportation agencies to collect and transmit data in real time (or near real time) for use in transportation operations. ITS are deployed to support safety, mobility, environmental, and other goals.

This survey asks about ITS deployed on **Freeways**, which include **controlled access roads**, **such as interstates and other freeways and expressways** (i.e., functional classifications 1 and 2 of Federal Highway Administration's Highway Functional Classification). For more information click: https://www.fhwa.dot.gov/planning/processes/statewide/related/highway functional classifications/section 00.cfm

Navigating the Survey:

Use the "Next" and "Previous" buttons below to navigate the survey. Answers from each survey page are automatically saved when you go to the **next** survey page.

To return to the dashboard, click on the "Return to Dashboard" button on the bottom of the page.

For many questions, there will be terms that are underlined. In this reference PDF, additional information for these terms is provided in a box below the question.

Note: The instructions in red font show the survey skip logic, which is automated in the online survey.

Real-Time Traffic Data Collection on Freeways

1. [ASK ALL] Does your agency deploy any roadside infrastructure technologies to collect time traffic data on freeways? Please select all that apply.			
		Inductive Loop Radar/microwave detection Video imaging detection Magnetometers Infrared/thermal detection Other (please specify): No roadside infrastructure technologies are deployed	
DEF	INI	ITIONS SHOWN IN HOVER BOXES:	
	roa	ive loop detectors are comprised of a series of wired loops that sense the presence of a vehicle on dway and transfer the signal to an electronic unit housed in a controller cabinet on the side of the ay.	
		microwave detection identifies vehicles by transmitting an electromagnetic signal that is reflected adar sensor once a vehicle passes through the area.	
imag	Video imaging detection (e.g., traffic and infrared cameras) uses cameras above traffic to capture images of passing vehicles. These images are analyzed by a vision processor using application specific algorithms to detect vehicles and monitor traffic.		
Mag prob		tometers detect a vehicle whenever a sufficient portion of its magnetic shadow falls on a sensor	
		d/Thermal detection identifies vehicles by transmitting infrared light or heat from a transmitter to a per placed on the opposite side of the road perpendicular to the direction of travel.	
	on Ple not	SK ALL] Has your agency deployed any vehicle probe readers to collect real-time traffic data freeways? Please select all that apply. Passe note that your response should include your agency's deployed equipment only; please do to include vehicle probe reader data purchased or obtained from an external source. Toll tag readers License plate readers Bluetooth readers Cellular/mobile phone readers In-vehicle GPS readers Other (please specify): No vehicle probe readers are deployed	
DEF	INI	ITIONS SHOWN IN HOVER BOXES:	
		g readers match tag numbers read at the starting and ending points of the segment of road to the travel times.	
vide	o in	e plate readers use optical cameras to capture images of oncoming or receding traffic and use mage processing to "read" the license plates. License plate numbers can also be matched at locations downstream.	

Bluetooth readers work by actively searching for in-range Bluetooth devices and capturing the unique

address of each device.

Cellular/mobile phone readers automatically and anonymously downloaded phone location information from cellular network switching centers in real time. The location of a cell phone on a roadway is determined by cell phone network handoff or signal tower triangulation and compared to a map database.

In-vehicle GPS readers are used in vehicles equipped with GPS to transmit positional information via GPS signal to a central control center.

3.	[ASK ALL] Does your agency use any external data sources (i.e., collected outside of your agency) for freeway management (e.g., incidents, road weather, traffic)? Please select all that apply. □ Notifications from the public via social media, emails, texts, phone calls, etc. □ Publicly available mapping and traffic information apps (e.g., Google Maps, Waze, etc.) □ Purchased third party commercial data (e.g., Inrix, HERE, TomTom) □ Other transportation agency data (e.g., Other State DOTs or districts, MPOs, etc.) □ Other (Please specify): □ No external data sources are used − SKIP TO Q6 □ Don't know − SKIP TO Q6
4.	[IF Q3 = RESPONSES 1,2, 3, 4, or 5] How is your agency using the freeway data obtained from external sources? Please select all that apply. □ Traffic incident management □ Work zone management □ Road weather management □ Traveler information □ Freeway management □ Performance management/measurement □ Road/ITS asset management □ Emergency management □ Traffic studies and/or project prioritization □ Safety analytics/management □ Other (please specify):
5.	 [IF Q3 = PURCHASED THIRD PARTY COMMERCIAL DATA] You indicated that your agency purchases third party commercial data. What type(s) of freeway data is your agency purchasing? Please select all that apply. Vehicle probe data Connected vehicle data Multimodal probe data Origin-destination (trip) data Non-recurring event data (e.g., incidents, closures, road weather events) Other (please specify):
	Imp Metering Control [ASK ALL] Has your agency deployed freeway entrance ramp metering? Please select one.
J .	 Yes No – SKIP TO Q9
	Not applicable (agency does not manage ramps) – SKIP TO Q9 SKIP TO Q9

7.	[IF	Q6 = YES] Which of the following capabilities applies to your agency's freeway ramp
	me	tering system?
		Fixed/pre-timed (e.g., based on historical data) – SKIP TO Q9
		Local adaptive/responsive based on real time traffic conditions in local vicinity of the ramp
		Corridor or system-wide adaptive/responsive based on real time traffic conditions along a facility,
		corridor, or system
		Other (please specify): – SKIP TO Q9
		· · · · · · · · · · · · · · · · · · ·
DE	FINI	TIONS SHOWN IN HOVER BOXES:
Ra	mp ı	metering uses traffic signals installed on freeway on-ramps to control the frequency at which
	-	s enter the flow of traffic on the freeway.
		·
Fix	ed/p	pre-timed ramp metering controls the frequency of vehicles at fixed times. Does not use traffic
	-	on or respond to real-time conditions.
Lo	cal a	adaptive/responsive ramp metering relies on real-time surveillance of traffic present on the
		on-ramp and adjacent freeway location(s) to select metering rates.
	,	
Со	rrido	or or system-wide adaptive/responsive ramp metering relies on real-time traffic surveillance of
		pstream and downstream from the ramp to calculate a metering rate.
		·
_		07 004 07 07 07 07 07 07
8.		Q7 = LOCAL ADAPTIVE OR CORRIDOR/SYSTEM ADAPTIVE]: Does your agency deploy any
		vanced ramp metering technologies (i.e., ramp metering integrated with other traffic nagement tools/strategies)? Please select all that apply.
	IIIa	
		Dynamic bottleneck identification
		Automated incident detection
		Integration with adjacent arterial traffic signals
		Other (please specify):
		No advanced metering technologies are deployed
	EFI	NITIONS SHOWN IN HOVER BOXES:
) Vna	mic bottleneck identification sets ramp metering rates for a series of ramps based on an
		ithm that identifies active bottlenecks on the freeway, and those metering rates are adjusted based
	_	langes to the bottlenecks (i.e., location and time).
`	,,,,	angos to the bottomone (i.e., location and time).
	Auto	mated incident detection sets ramp metering rates based on an automated incident detection
		ithm that uses traffic monitoring equipment (e.g., detectors and CCTV cameras) to identify freeway
		ents in real-time. If an incident is detected, the metering rates will adjust to account for the loss of
		city at the incident location.
'	apa	bity at the incluent location.
J.	ntea	ration with adjacent arterial traffic signals occurs when ramp meter signals are integrated with
	_	ent arterial traffic signals based on ramp and adjacent arterial queues and volumes. Ramp
	-	
		ring rates and/or arterial traffic signals will adjust to reduce backups on the ramps and adjacent
a	irteri	als for vehicles entering the freeway.

Managed Lanes

	<u>ma</u>	K ALL] Does your agency and/or another entity (e.g., public/private partnership) operate naged lanes on freeways? Please select all that apply.
		Yes, my agency
		Yes, other entity (e.g., public/private partnership)
		No, neither – SKIP TO Q11
DEF	INI	TION SHOWN IN HOVER BOX:
Mar	200	ed lanes is a concept where a "freeway-within-a-freeway" is created by separating a set of lanes
with facil	in tl ity i	he freeway cross section from the general-purpose lanes. The operation of and demand on the s managed using a combination of tools and techniques (e.g., pricing, vehicle eligibility, and
acc	ess	control) in order to continuously achieve an optimal condition, such as free-flow speeds.
	-	Q9=YES] Which managed lane strategies are used on freeways? Please select all that apply.
		Hard shoulder running
		High Occupancy Vehicle (HOV)
		High Occupancy Vehicle (HOV) Lane use control (open/closed/direction arrow or chevron)
		,
		Reversible flow
		Transit only
		Truck only
		Variable speed limits
		Other congestion pricing strategy
	Ш	Other managed lane strategy (please specify):
Aut	om	ated Enforcement
11.	-	K ALL] Does your agency deploy automated enforcement on freeways? Please select one.
	-	Yes
	0	No – SKIP TO Q13
12.	[IF	Q11 = YES] What automated enforcement technologies does your agency use on freeways?
	Ple	ase select all that apply.
		<u>License plate recognition</u>
		Cameras
		Toll tag readers
		Radar
		Other (please specify):
DEF	INI	TIONS SHOWN IN HOVER BOXES:

License plate recognition uses optical cameras to capture images of oncoming or receding traffic and use video image processing to "read" the license plates. License plate numbers can also be matched at sensor locations downstream.

Toll tag readers match tag numbers read at the starting and ending points of the segment of road to estimate travel times.

Radar detects vehicles by transmitting an electromagnetic signal that gets reflected to the radar sensor once a vehicle passes through the area.

Safety and Road Weather Management

13.	[AS	SK ALL] Has your agency deployed any Intelligent Transportation Systems (ITS) safety	
	systems on freeways? Please select all that apply.		
		Automated and/or manual freeway ramp gate	
		Automated visibility warning system	
		Downhill truck speed warning	
		Dynamic curve warning system	
		Lane use control on general purpose lanes	
		Over-height warning system (e.g., bridge, tunnel, gantries)	
		Queue warning system	
		Reference location sign	
		Variable speed limit	
		Wildlife warning system	
		Wireless truck roadside inspection	
		Wrong way driving detection system	
		Other (Please specify):	
		No ITS safety systems are deployed	

DEFINITIONS SHOWN IN HOVER BOXES:

Automated and/or manual freeway ramp gate controls access to selected ramps to all traffic or specific vehicle classes, limiting the periods of access or permanently restricting access.

Automated visibility warning system uses weather sensors to detect reduced visibility conditions and then triggers a dynamic message sign with a warning indicating the adverse driving conditions.

Downhill truck speed warning alerts drivers (e.g., illuminated signs) to slow down if their vehicle speed is too high to travel safely downhill.

Dynamic curve warning system detects vehicles approaching a curve and activates a warning to drivers (e.g., illuminated signs, flashing beacons, etc.) to slow down if their vehicle speed is too high to travel safely through the curve.

Lane use control on general purpose lanes dynamically closes individual lanes during incidents or opens shoulders for part-time travel to increase capacity during congestion periods.

Over-height warning system detects vehicles and activates a warning to drivers (e.g., illuminated signs, flashing beacons, etc.) identifying upcoming tunnels, bridges, or other obstacles that may limit the size of the vehicle that can pass.

Queue warning system uses sensors to display messages on dynamic message signs to warn drivers about stopped or slowed traffic ahead.

Variable speed limit uses current traffic conditions to determine the appropriate speed at which drivers should be traveling and displays this information on dynamic message signs.

Wildlife warning system detects the presence of an animal on or near the road and activates a warning to drivers (e.g., illuminated signs, flashing beacons, etc.).

Wireless truck roadside inspection wirelessly and electronically assesses the safety of a truck and its driver without requiring them to stop.

Wrong way driving detection system detects vehicles traveling in the wrong direction and alerts the driver. May also have a traffic or CCTV camera to record the incident.

 14. [ASK ALL] Does your agency use any ITS Road Weather Information Systems (RWIS)/Environmental Sensor Stations (ESS) to collect weather and road condition data on freeways? Please select all that apply. Mobile (vehicle-mounted) Permanent (stationary) Transportable (temporary use for work zones, recurring problem spots, etc.) Other (Please specify): No ITS (RWIS/ESS) are deployed to collect weather and road condition data
DEFINITIONS SHOWN IN HOVER BOXES:
Environmental sensor stations (ESS) are at a fixed roadway location with one or more sensors measuring atmospheric, pavement, and/or water level conditions.
Road Weather Information Systems (RWIS) are comprised of environmental sensor stations (ESS), a communication system for data transfer, and a central system to collect and process the field data. The data is used to disseminate road weather information.
 15. [ASK ALL] Does your agency use any tools and/or strategies for managing adverse road weather impacts on freeways? Please select all that apply. Automated vehicle location (AVL) Decision support systems Dynamic message signs (permanent and/or portable) Pathfinder Queue warning systems Ramp metering Resource pre-positioning (e.g., pre-positioning trucks for plowing) Route optimization Traffic modeling and/or analysis Variable speed limits Other (please specify): No tools or strategies are used to manage adverse road weather impacts
DEFINITIONS SHOWN IN HOVER BOXES
Pathfinder is a communication and collaboration strategy developed by Federal Highway Administration and supported by National Weather Service. For more information, see: https://ops.fhwa.dot.gov/publications/fhwahop18034/index.htm . Route Optimization is a static or adaptive routing response tool and/or strategy based on road weather conditions, incidents, recurring problem areas, etc.
Incident Detection 16. [ASK ALL] Does your agency use any incident detection/verification methods on freeways? Please select all that apply. Closed Circuit Television (CCTV) Call boxes Computer algorithms to detect incidents External data (e.g., data provided by crowdsourcing, commercial providers, or citizen-reported) Other (Please specify):

Work Zone Management

	wo	rk zones on freeways? Please select one.
	0	Yes
	0	No – SKIP TO Q19
18.	[IF	Q17 = YES] Which ITS technologies does your agency deploy at work zones on freeways?
	Ple	ease select all that apply.
		<u>Dynamic lane merge system</u>
		Intrusion alarm
		Portable CCTV
		Portable dynamic message sign
		Portable dynamic speed feedback/speed radar trailer
		Portable traffic monitoring device
		Queue detection and alert system
		Route guidance around work zones
		<u>Travel time system</u>
		Temporary ramp metering
		Variable speed limit
		Other (please specify):

17. [ASK ALL] Does your agency deploy Intelligent Transportation Systems (ITS) technology at

DEFINITIONS SHOWN IN HOVER BOXES:

Dynamic lane merge system uses dynamic message signs and other devices to control vehicle merging behavior.

Intrusion alarm detects errant vehicles entering the work zone and alerts workers.

Portable CCTV system provides visual surveillance and is typically mounted in a light truck or van or on a trailer.

Portable dynamic message sign (DMS) displays a variety of messages to inform motorists of unusual driving conditions.

Portable dynamic speed feedback/speed radar trailer systems are portable traffic control devices that display a driver's speed or provide a message to drivers exceeding a certain speed threshold.

Portable traffic monitoring device uses radar or microwave detection to collect traffic-related data and communicates this information in real-time to a central server, which can also be automatically conveyed to motorists via a public website or portable dynamic message signs.

Queue detection and alert system uses sensors upstream of a work zone and displays messages on dynamic message signs to warn drivers about stopped or slowed traffic ahead.

Route guidance around work zones advises drivers of alternative routes when work zones necessitate lane closures or other types of diversions.

Travel time system measures actual traffic flow conditions using vehicle travel time detectors and displays current travel time information (e.g., on messaging signs, websites, etc.).

Temporary ramp metering involves temporarily installing signals on freeway on-ramps to control the frequency at which vehicles enter the flow of traffic on the freeway.

Variable speed limit uses current traffic conditions to determine the appropriate speed at which drivers should be traveling and displays this information on dynamic message signs.

Traveler Information

traditional cellular network.

ASK ALL] What methods does your agency use to disseminate real-time traveler information about freeways? Please select all that apply. 511 Social media Email or text/SMS alert Agency-branded mobile application (e.g., white-label commercial app, custom built) Third party mobile app (e.g., Google Maps, Waze) Dynamic message signs (permanent and/or portable) Website Highway Advisory Radio Other (please specify): No real-time traveler information about freeways is disseminated
[ASK ALL] Does your agency provide an open data feed that shares real-time transportation-related data using data standards/specifications? Please select one. Yes No, but my agency is working on this No current plans for an open data feed
[IF Q20=YES] What data standards/specifications are used to share real-time transportation- ted data in your agency's open data feed? ☐ Work Zone Data Exchange (WZDx) specification ☐ Traffic Management Data Dictionary (TMDD) standard ☐ PC5-based C-V2X specification (5.9GhZ) ☐ Other communications interface, data format, and/or protocol (please specify:) ☐ Don't know
Work Zone Data Exchange (WZDx) specification enables infrastructure owners and operators (IOOs) to make harmonized work zone data available for third party use. The goal of WZDx is to enable widespread access to up-to-date information about dynamic conditions occurring on roads such as construction events. Traffic Management Data Dictionary (TMDD) standards were developed to support center-to-center communications. TMDD provides the dialogs, message sets, data frames, and data elements to manage the shared use of Intelligent Transportation Systems (ITS) devices and the regional sharing of data and incident management responsibility.

PC5-based C-V2X specification (5.9GhZ) uses device-to-device radio access technology for direct low latency connectivity between user equipment within a wide-area network independent of the

Connected Vehicle Technologies

This section includes questions about your agency's deployment of connected vehicle (CV) technologies. Your responses should only include CV technologies deployed on **freeways** (i.e., do not include CV deployment on arterial roads).

- 21. [ASK ALL] Is your agency currently developing, testing, or deploying <u>connected vehicle (CV)</u> technology on freeways? *Please select one.*
 - o Yes SKIP TO Q24
 - No, but my agency is planning for CV
 - No plans for CV SKIP TO Q29
 - Don't know SKIP TO Q29

DEFINITION SHOWN IN HOVER BOX:

Connected vehicle (CV) technologies enable vehicles, roadway infrastructure, and mobile devices to wirelessly exchange data and "talk" to one another. Connected vehicles encompass vehicle-to-vehicle (V2V), vehicle-to-infrastructure (V2I), and vehicle-to-pedestrian (V2P) communications, collectively known as "V2X." When integrated into a vehicle, roadway infrastructure, or mobile device, these technologies can deliver significant transportation safety, mobility, and environmental benefits.

- 22. [IF Q21 = NO, BUT PLANNING FOR CV] Does your agency have any documented plans (e.g., internal planning documents, State Transportation Improvement Plan (STIP), etc.) to develop, test, or deploy connected vehicle technology on freeways? Please select one.
 - o Yes
 - o No
 - Don't know
- 23. [IF Q21 = NO, BUT PLANNING FOR CV] When do you expect to begin developing, testing, or deploying connected vehicle technology on freeways? Please select one.
 - Within the next 3 years SKIP TO Q29
 - In 3 to 6 years SKIP TO Q29
 - In 7 or more years SKIP TO Q29
 - Don't know SKIP TO Q29
- 24. [IF Q21 = YES] Is your agency deploying roadside units (RSUs) on freeways to support connected vehicle and/or automated vehicle testing/deployment? Please select one.
 - Yes
 - No SKIP TO Q27
 - Don't know SKIP TO Q27
- 25. [IF Q24 = YES] Approximately how many roadside units (RSUs) is your agency currently testing or deploying on freeways? Please select one.
 - o **1-10**
 - 0 11-50
 - o **51-150**
 - o 151 or more

26.	[IF Q24 = YES] On freeways, what standard data structures are being transmitted for your
	connected vehicle system (e.g., from your roadside units, connected vehicles, etc.)? Please
	select all that apply.
	□ Basic Safety Message (BSM)
	☐ MAP data (e.g., ramp metering)
	□ Position Correction Message (RTCM)
	□ Roadside Safety Message (RSM)
	☐ Sensor Data Sharing Message (SSDM)
	☐ Signal Phase and Timing (SPaT) (e.g., ramp metering)
	☐ Traveler Information Messages (TIM)
	☐ Other (please specify):
	□ Don't know
27.	[IF Q21 = YES] Is your agency developing, testing, or deploying any connected vehicle applications for use on freeways - (i.e., using an in-vehicle onboard unit (OBU), Human Machine Interface (HMI), handheld device, or similar)? This may include applications that your agency is testing either on its own fleet or in partnership with automakers/original equipment manufacturers. • Yes • No – SKIP TO Q29 • Don't know – SKIP TO Q29
28.	[IF Q27 = YES] Which connected vehicle (CV) applications is your agency developing, testing, or deploying on freeways? This may include applications that your agency is testing either on its own fleet or in partnership with automakers/original equipment manufacturers. Please select all that apply.
Saf	fety Applications (Vehicle to Infrastructure (V2I)):
	□ Curve Speed Warning (CSW)
	□ Reduced Speed/Work Zone Warning (RSWZ)
_	
Sat	fety Applications (Vehicle to Vehicle (V2V)):
	Blind Spot/Lane Change Warning (BSW/LCW)
	Emergency Electronic Brake Lights (EEBL)
	□ Forward Collision Warning (FCW)
Мо	bility Applications:
	☐ Queue Warning (Q-WARN)
En	vironment Applications:
	Dynamic Eco Routing
_	
Ag	ency and Road Weather Applications:
	Agency Data Applications (e.g., probe data collection, CV-enabled data collection etc.)
	Road Weather Warnings (e.g., Motorist Advisories and Warnings (MAW); Enhanced Maintenance
	Decision Support System (MDSS))
Oth	ner CV applications being developed, tested, deployed:
	□ Please specify any other CV applications:

DEFINITIONS SHOWN IN HOVER BOXES:

Curve Speed Warning (CSW) alerts a driver if current speed is too fast for an approaching curve.

Reduced Speed/Work Zone Warning (RSWZ) alerts a driver to use caution when traveling through a work zone.

Blind Spot/Lane Change Warning (BSW/LCW) alerts a driver changing lanes if there is a vehicle in the driver's blind spot.

Emergency Electronic Brake Lights (EEBL) application notifies a driver if there is a sudden-braking vehicle ahead (or several vehicles ahead).

Forward Collision Warning (FCW) alerts a driver when a vehicle ahead is stopped or traveling slower and there is a risk of a rear-end collision.

Queue Warning (Q-WARN) provides a vehicle operator with sufficient warning of an impending queue backup, allowing the operator to brake safely, change lanes, or modify the route such that secondary collisions can be minimized or even eliminated. It is distinct from collision warning, which pertains to events or conditions that require immediate or emergency actions.

Dynamic Eco-Routing application determines the most eco-friendly route, in terms of minimum fuel consumption or emissions, for individual travelers. This application recommends routes that produce the fewest emissions or reduce fuel consumption based on historical, real-time, and predicted traffic and environmental data (e.g., prevailing weather conditions).

Agency Data Applications include applications used to collect, transmit, analyze, or report local data related to traffic conditions, road conditions, travel patterns, or other metrics. Examples include: Probebased Pavement Maintenance, Probe-based Traffic Monitoring, CV-enabled Origin-destination Studies, Work Zone Travel Information applications, etc.

Road Weather Warnings issue alerts and advisories to travelers about deteriorating road and weather conditions on specific roadway segments.

Automated Vehicle Technologies

This section asks about automated vehicle tests and deployments **on freeways**; your responses should also include any pilots or demonstrations related to automated vehicles.

29. [ASK ALL] Has your agency participated in any <u>automated vehicle (AV)</u> tests or deployments on freeways in the last five years? Please select all that apply.

- Yes, my agency is leading or has led AV testing/deployment (i.e., completed or in progress) –
 SKIP TO Q32
- Yes, my agency is supporting or has supported the planning or execution of the AV testing/deployment – SKIP TO Q32
- o No, my agency is not participating in any AV testing or deployment
- Don't know

DEFINITION SHOWN IN HOVER BOX:

Automated vehicles (AVs) are those in which at least some aspect of a safety-critical control function (e.g., steering, throttling, or braking) occurs without direct driver input. AVs may include light duty vehicles, transit vehicles, commercial motor vehicles, and small delivery devices, among others. Automated vehicles are widely categorized by their levels of driving automation defined by the Society of Automotive Engineers (SAE). These levels begin with Level 0 (no driving automation) and conclude with Level 5 (full driving automation).

30.	pla	Q29 = NO or DON'T KNOW] Does your agency have any documented plans (e.g., internal nning documents, State Transportation Improvement Plan (STIP), etc.) to participate in comated vehicle (AV) testing or deployment on freeways in the future? Please select one. Yes, my agency has a documented plan No, but my agency is considering AV testing or deployment No, my agency is not considering AV testing or deployment – SKIP TO Q35 Don't know – SKIP TO Q35
31.	-	Q30 =YES HAS DOCUMENTED PLAN OR CONSIDERING] When does your agency expect to ticipate in automated vehicle testing or deployment on freeways? Please select one. Within the next 3 years – SKIP TO Q35 In 3 to 6 years – SKIP TO Q35 In 7 or more years – SKIP TO Q. 35 Don't know – SKIP TO Q. 35
32.	_	IF Q29 = AGENCY SUPPORTING (OPTION 2 ONLY)] Which entity(ies) are/were leading the comated vehicle testing or deployment on freeways? Please select all that apply.
aut	oma	F Q29 = AGENCY LEADING (OPTION 1 ONLY OR BOTH OPTIONS 1 AND 2)] For the ated vehicle testing or deployments on freeways that your agency is/was leading, what entity(ies) are/were you partnering with? Please select all that apply.
		Automakers or Original Equipment Manufacturers (OEMs), including Transit Vehicle Manufacturers
		Advanced Driver Assistance Systems (ADAS) Developers (or Driver Support Features Developers)
		Automated Driving Systems (ADS) Developers
		Transportation Network Companies (TNCs) (e.g., Uber or Lyft)
		State agencies
		Metropolitan Planning Organizations (MPOs)
		Universities
		Transit agencies
		Other local agencies
		Private sector consultants (please specify):,

☐ Other (please specify): _____

☐ Don't know

33. [IF Q29 = AGENCY LEADING OR SUPPORTING] Which of the following automated vehicle (AV) tests or deployments on freeways has your agency led or supported in the last five years? Please include Advanced Driver Assistance Systems (ADAS) or Automated Driving Systems (ADS) tests or deployments. Please select all that apply. **Automated Transit/On-Demand Tests/Deployments:** ■ Automated Bus Rapid Transit (BRT) ■ Automated Passenger Fixed Route ■ Automated Passenger On-Demand ☐ Automated Maintenance and Bus Yard Operations Automated Delivery/Freight/Commercial Motor Vehicle Tests/Deployments: ☐ Automated Last Mile Delivery (e.g., light duty vehicle) – OMIT FROM Q34 ■ Automated Regional or Long-Haul Trucking – OMIT FROM Q34 ☐ Truck Platooning – OMIT FROM Q34 Automated Logistics Yard Operations (e.g., automated yard trucks) – OMIT FROM Q34 ☐ Construction or Maintenance Operations (e.g., automated truck-mounted attenuators) – OMIT FROM Q34 **Automated Light Duty Passenger Vehicle Tests/Deployments:** Automated light duty passenger vehicle test/deployment – OMIT FROM Q34 Other AV Test/Deployments on freeways:

DEFINITIONS SHOWN IN HOVER BOXES:

Automated Bus Rapid Transit (BRT) applies rail transit concepts to automated buses to deliver fast and efficient service. These concepts focus on eliminating causes of delay that typically slow regular bus services and may include dedicated lanes, busways, traffic signal priority, off-board fare collection, platforms, and enhanced stations.

□ Other AV test/deployment (please specify): _____ – OMIT FROM Q34

Automated Passenger Fixed Route service provides rides along a single route with pre-defined stops and a set schedule. The route may be limited to closed environments, such as parking lots, busways, campuses, and retirement communities, or it may operate in mixed traffic on public roads in areas, such as business parks or downtown districts.

Automated Passenger On-Demand provides on-demand service between any two addresses within a defined service area. The concept is similar to the automated passenger fixed route service; however, it is not restricted to predefined routes or schedules - users can request pick-ups and drop-offs on demand (e.g., using an application on a smartphone, tablet, or kiosk).

Automated Maintenance and Bus Yard Operations is the deployment of automated driving systems (ADS) on transit vehicles for use within the domain of the bus yard. Use cases may include precision movement for fueling/recharging, maintenance, disinfection/bus wash, or automated parking and recall.

Automated Last Mile Delivery (e.g., light duty vehicle) uses automation to deliver goods over short distances on local roadways from business to consumer.

Automated Regional or Long-Haul Trucking applies automation to trucking. Automated trucking generally refers to SAE Level 3-5 automation, where the automated driving system is primarily responsible for monitoring the driving environment.

Truck Platooning incorporates on-board computers, vehicle sensors, and automated driving technology, allowing equipped long-haul trucks to communicate with each other and travel closely together on the highway (40 to 50 feet apart) to improve fuel efficiency and reduce vehicle emissions.

Automated Logistics Yard Operation is the deployment of automation (e.g., robots, yard trucks with automated driving systems) to perform logistics tasks in the yard. For example, this may include moving trailers from one part of the yard to another.

Construction or Maintenance Operations (e.g., automated truck mounted attenuator) is the deployment of automated driving systems (ADS) on commercial vehicles for the purpose of performing construction and maintenance activities on the road.

Automated light duty passenger vehicle test/deployment: Use this category for any light-duty passenger vehicle test/deployment not covered in other categories.

34.	For your [Q33 = AUTOMATED BUS RAPID TRANSIT / AUTOMATED PASSENGER FIXED ROUTE A
	AUTOMATED PASSENGER ON DEMAND / AUTOMATED MAINTENANCE AND BUS YARD
	OPERATIONS] test or deployment, which type of vehicle is being used? Please select all that
	apply.
	Full-sized transit bus
	☐ Articulated bus
	☐ Motorcoach (over the road bus)
	□ Cutaway bus or minibus
	□ Novel-design low-speed shuttle
	☐ Light-duty passenger vehicle (e.g., car, van, SVU)
	Other (please specify):
	□ Don't know

Telecommunications

35.	[ASK ALL] What type of telecommunications technologies does your agency use to enable ITS
	on freeways? Please select all that apply.

Wired:	
	Coaxial - OMIT FROM Q36
	Fiber optic cable - OMIT FROM Q36
	Twisted copper pair/Twisted wire pair
	Digital subscriber line (DSL)
	Data cable over modem

Wireless:

eie:	55.	
	5G New Radio and Small cell infrastructure

	Microwave – OMIT FROM Q36	
	Other telecommunications (wired and/or wireless) (please specify):	- OMIT FROM Q36
	Don't know – SKIP to Q37	
	No telecommunications used to enable ITS on freeways – SKIP to Q37	
	Not applicable, no ITS infrastructure or devices are deployed – SKIP to Q37	

DEFINITIONS SHOWN IN HOVER BOXES:

Coaxial cable is mainly used to provide communications between field controllers and a central controller. Coaxial cables have an inner conductor, insulating layer, conductive shielding, and protective outer jacket.

Fiber-optic cables are made up of many super thin strands of optical glass fiber that make it possible to transmit large amounts of information over long distances (e.g., camera images).

Twisted copper pair/Twisted wire pair is composed of two insulated copper wires twisted around one another. This is mainly used to provide basic telephone services and ethernet over short distance.

Digital subscriber line (DSL) is a wireline transmission technology that uses existing infrastructure to provide integrated traffic video and field device communications. This includes all forms of DSL (e.g., ADSL, RADSL, HDSL, SDSL).

Data cable over modem service enables operators to provide broadband using standard cable lines (e.g., 56 kilobits/second).

5G New Radio and 5G small cell infrastructure (which communicates over very short distances) represents the newest generation of cellular data communication. The 5G New Radios can operate within and share existing 4G LTE infrastructure in non-standalone (NSA) mode (e.g., cell towers). The other critical component of 5G, small cell infrastructure, consists of small antennae placed in the public right-of-way to act as a high-speed intermediary between a field device and the larger cell tower.

Cellular (LTE-4G) is the fourth generation of cellular data communication. LTE (Long Term Evolution) is standard to 4G and is both forward and backward compatible. Cellular LTE 4G operates in: 600 MHz, 700 MHz, 850 MHz, 1.7 GHz, 1.9 GHz, 2.3 GHz, 2.5 GHz spectrum.

Cellular GPRS – 2G or 3G are the older generations of cellular data communications and are being phased out. These generations of cellular rely on radio signals in a digital format and operate in the 470-690 MHz, 690-805 MHz, 1.850-1.995 GHz spectrum.

LTE-Cellular V2X (LTE-CV2X) operates in the reduced 5.895-5.925 GHz spectrum, known as the Safety Band (dedicated for safety-of-life and public benefit transportation purposes). LTE-CV2X is intended to service connected vehicle technology.

Dedicated short range communications (DSRC) is two-way radio communication operating in the reduced 5.895-5.925 GHz spectrum, currently known as the Safety Band (dedicated for safety-of-life and public benefit transportation purposes). The Federal Communications Commission (FCC) is planning to phase out DSRC in the future.

Wi-Fi provides wireless high-speed internet access or communications between devices (point-to-point or point-to-multipoint). It includes agency-installed Wi-Fi access points and client devices, or subscription-based Wi-Fi in the 2.4 GHz, 5.8 GHz, and (recently) 6 GHz spectrum.

Mobile or Fixed service satellite (FSS) provides radio communication between two or more fixed or mobile receivers. MSS or FSS allows uploading/downloading data across a wide range (137 MHz-51.4 GHz) of spectrum in the form of space-to-earth, earth-to-space, or broadcast communications.

Ultra-wideband (UWB) is a short-range communication technology ideal for transmitting data at high speeds between devices 10 to 30 meters apart, using any spectrum as unlicensed communications (similar to radar).

Microwave (also known as Ultra High Frequency (UHF) or Extremely High Frequency (EHF)) communicates as fixed point-to-point backhaul or as very short-range, line-of-sight radar/Lidar communications, typically between 300 MHz and 300 GHz spectrum.

36. [IF Q35 = EACH TELECOM TECH CHECKED EXCEPT FOR COAXIAL, FIBER OPTIC CABLE, FS5	۰,
and MICROWAVE OPTIONS] Please indicate how your agency is using the telecommunication	
technology(ies) shown below to enable ITS on freeways.	
Each of the use cases listed is based on Architecture Reference for Cooperative and Intelligent	
Transportation (ARC-IT) service packages. Click this link for more information: https://www.arc-	
it.net/html/servicepackages/servicepackages-areaspsort.html. Please select all that apply in each	
column.	
☐ Commercial Vehicle Operations

EXAMPLES SHOWN IN HOVER BOXES:

☐ Don't know

Commercial Vehicle Operations: Examples include commercial vehicle parking, smart roadside and weigh in motion, roadside commercial vehicle operator safety, freight-specific dynamic travel planning, hazmat management, etc.

Data Management: Two relevant service packages are ITS data warehouse and performance monitoring.

Maintenance and Construction: Examples include maintenance and construction vehicle maintenance, winter maintenance, roadway maintenance and construction, work zone management, asset tracking, etc.

Parking Management: Examples include parking space management, smart park and ride system, parking electronic payment, regional parking management, etc.

Public Safety: Examples include emergency response, mayday notification, incident scene safety monitoring, disaster response and recovery, disaster traveler information, etc.

Public Transportation: Examples include dynamic transit operations, transit fare collection management, transit security, transit fleet management, transit signal priority, intermittent bus lanes, etc.

Support: Examples include connected vehicle system monitoring and management, map management, ITS communications, location and time, security and credentials management, field equipment maintenance, etc.

Sustainable Travel: Examples include emissions monitoring, eco-traffic metering, roadside lighting, electric charging stations management, HOV/HOT lane management, eco-lanes management, etc.

Traffic Management: Examples include infrastructure-based traffic surveillance, vehicle based traffic surveillance, connected vehicle traffic signal system, traffic incident management system, electronic toll collection, variable speed limits, speed harmonization, etc.

Traveler Information: Examples include broadcast traveler information, dynamic roinfrastructure- provided trip planning and route guidance, dynamic ridesharing, and etc.	=
Vehicle Safety: Examples include autonomous vehicle safety systems, V2V basic sawareness, curve speed warning, queue warning, restricted lane warnings, automate	-
Weather: Examples include weather data collection, weather information processing weather impact warning, etc.	g and distribution, spot
37. [ASK ALL] If your agency has any notes or additional information about its telecommunications, please provide below.	s use of
Maintenance of Freeway ITS Technology	
 38. [ASK ALL] Does your agency utilize an asset management system to track Transportation Systems (ITS) inventory and/or ITS maintenance and oper freeways? Please select all that apply. Yes, system tracks inventory of ITS field devices Yes, system tracks inventory of ITS central systems / software Yes, system tracks maintenance and operations of ITS field devices Yes, system tracks maintenance and operations of ITS central systems / so No, my agency does not have an ITS asset management system Not applicable, my agency has not deployed ITS – SKIP TO Q40 DEFINITION SHOWN IN HOVER BOX:	ations activity on
An ITS asset management system is a software system, procedure, or tool that as managing and maintaining data on ITS assets across the entire lifecycle of these as disposal. For more information see: https://ops.fhwa.dot.gov/publications/fhwahop20	ssets, from acquisition to
 39. [EXCLUDE IF Q38 = OPTION 6 NO ITS] What is your agency's primary approached conducting maintenance activities on freeway ITS assets? Please select of the My agency primarily schedules maintenance based on the regularly monitor freeway ITS assets. My agency primarily schedules maintenance of freeway ITS assets based of My agency primarily conducts maintenance in response to reported freeway events, such as a vehicle collision or component failure. Other (please specify): Don't know 	ne. ored condition of on regular intervals.

Transportation Systems Management and Operations (TSMO) Plan

- **40.** [ASK ALL] Does your agency have a Transportation Systems Management and Operations (TSMO) Plan? *Please select one.*
 - o Yes
 - o No, but my agency plans to develop a TSMO Plan
 - No current plans to develop a TSMO plan

Cybersecurity

- 41. [ASK ALL] Does your agency have a documented cybersecurity policy that explicitly addresses Intelligent Transportation Systems (ITS) technologies/equipment? Please select one.
 - My agency has a cybersecurity policy which explicitly addresses ITS. SKIP TO Q43
 - My agency's general cybersecurity policy (i.e., for information technology (IT)) is applied to ITS.
 - My agency's ITS is not covered by a cybersecurity policy.
 - My agency has not deployed ITS technologies/equipment. SKIP TO Q44
 - Don't know SKIP TO Q43
- 42. [IF Q41 = OPTIONS 2 or 3] Is your agency planning to develop a cybersecurity policy that explicitly addresses ITS? Please select one.
 - Yes
 - o No
 - Don't know
- 43. [EXCLUDE IF Q41=OPTION 4 (NO ITS)] In the last five years, has your agency conducted incident response exercises that include ITS equipment/technologies to prepare for ITS cybersecurity events? Please select one.
 - Yes, my agency's incident response exercises have included ITS equipment/technologies
 - O No, my agency's incident response exercises have not included ITS equipment/technologies
 - No, my agency has not conducted incident response exercises in the last five years
 - Don't know

DEFINITION SHOWN IN HOVER BOX:

Incident response exercises are agency-run tests of protocols that mitigate violations of security policies and recommended practices.

t t a l c	EXCLUDE IF Q 41 = OPTION 4 (NO ITS)] In the last three years, has your agency had any sybersecurity events or attacks (e.g., ransomware, data breach) that affected its information echnology (IT) system and/or ITS technologies/equipment on freeways? Please select all that apply. If your agency has experienced multiple events or attacks, please respond based on all experiences. If Yes, affecting IT system If Yes, affecting ITS technologies/equipment If No - SKIP TO Q47 If Don't know - SKIP TO Q47

Regional ITS Architecture

- 47. [ASK ALL] Is your agency/region covered by a Regional (or State) Intelligent Transportation Systems (ITS) Architecture? Please select one.
 - Yes
 - o No SKIP TO Q50
 - Don't know SKIP TO Q50
 - Not familiar or never heard of a Regional ITS Architecture SKIP TO Q50

DEFINITIONS SHOWN IN HOVER BOXES:

A **Regional ITS Architecture** is a plan for institutional and technical integration of ITS in a region or state. A Regional ITS Architecture uses the National ITS Architecture (which provides a common framework for planning, defining, and integrating ITS deployments) as the template for its definition, including only the systems and services that are planned for implementation in the local area or state. For more information about the Regional ITS Architecture, see: https://ops.fhwa.dot.gov/its_arch_imp/index.htm. For more information about the National ITS Architecture see: https://www.arc-it.net/.

- 48. [IF Q47 = YES] Is your agency using your Regional (or State) ITS Architecture to support ITS deployments on freeways? Please select one.
 - Yes, for all ITS deployments SKIP TO Q50
 - o Yes, for some ITS deployments GO TO Q49b
 - o No, my agency does not use our Regional ITS Architecture GO TO Q49a
 - Not applicable (i.e., my agency does not use federal funds for ITS deployment OR my agency has not deployed ITS) – SKIP TO Q50
 - Don't know SKIP TO Q50
- 49. a. [IF Q48=OPTION 3 (NO DOES NOT USE)] What are key reasons for NOT using your Regional (or State) ITS Architecture to support freeway ITS deployments? Please select all that apply.

49 b. [IF Q48= OPTION 2 (YES FOR SOME ITS DEPLOYMENTS)] What are key reasons for NOT using your Regional (or State) ITS Architecture to support all of your freeway ITS deployments? Please select all that apply.

Lack of experience/technical expertise with the Regional ITS Architecture
The Regional ITS Architecture is out of date
The scope and/or scale of my agencies' ITS projects are generally too small
No perceived technical or operational benefit to using the Regional ITS Architecture
Other (please specify):

Integrated Corridor Management

This question focuses on Integrated Corridor Management (ICM). ICM is an approach that manages a transportation corridor as a multimodal system (freeway, arterial, and public transit), integrating operations such as traffic incident management, work zone management, traffic signal timing, managed lanes, real-time traveler information, and active traffic management to maximize the capacity of all facilities and modes across the corridor.

For the purposes of this survey, a corridor is defined as: a largely linear geographic band and a bounded travel shed of (mostly) commute and daily trips. The corridor must include **freeway**, **arterial**, and **public transit facilities**, with cross-facility connections.

You can find more information about ICM at https://rosap.ntl.bts.gov/view/dot/38816.

- 50. [ASK ALL] Has your agency deployed Integrated Corridor Management (ICM) in one or more corridors (i.e., integrating operations across freeway, arterial, and public transit networks) to actively manage travel demand and capacity in the corridor as a whole? Please select one.
 - Yes, my agency has deployed ICM
 - No, but my agency plans to deploy ICM
 - No, my agency has no plans to deploy ICM

Agency Coordination

51. [ASK ALL] Does your agency RECEIVE the following incident information in real-time from any public safety agency? Please select one response for each item.

	Yes	No
Incident clearance	0	0
Incident severity and type	0	0

52. [ASK ALL] Does your agency PROVIDE real-time incident information (e.g., type, severity) to the following types of agencies? Please select one response for each agency type.

Freeway Incident Information

•	Yes	No
Freeway management agencies	0	0
Arterial management agencies	0	0
Public transit agencies	0	0
Law enforcement public safety agencies	0	0
Fire rescue public safety agencies	0	0
Other agencies (please specify)	0	0

53. [ASK ALL] Does your agency PROVIDE real-time freeway traffic information (e.g., travel times,			
speed, and condition) to the following types	of agenci	cies? Please select one response for each	
	agency type. Freeway Traffic Information		
	Yes	No	
Freeway management agencies	0	0	
Arterial management agencies	0	0	
Public transit agencies	0	0	
Law enforcement public safety agencies	0	0	
Fire rescue public safety agencies	0	0
